## **Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in this present application.

## **Claims**

- 1-5 (cancelled)
- 6. (currently amended) An electric power controller for a vehicle, comprising:

an overheat detector for detecting whether a power line supplying power from a vehicle battery to <u>a</u> vehicle load is overheated;

a voltage detector for detecting a voltage of the vehicle battery;

a voltage converter for converting power from the vehicle battery into a proper voltage and outputting a switching control signal reflecting the proper voltage;

a switching unit for performing ON/OFF switching operations based on the switching control signal to control power from the vehicle battery to the vehicle load; and

a controller for inputting an overheat signal from the overheat detector and the voltage from the voltage detector, determining whether there is an abnormal current, outputting a switching control signal, corresponding to a result to analyze change of the voltage, to the switching unit, and adjusting occurrence intervals of switching control signals, corresponding to respective ON and OFF states, to control the magnitude of effective value of vehicle power supplied to the vehicle load via the switching unit.

7. (original) The electric power controller as set forth in claim 6, wherein:

International Filing Date: 16 July 2004 Attorney Docket No.: 21334-1565

the controller outputs determination information of the abnormal current according to the change of the voltage; and

2 2 2 7

the electric power controller further comprises a diagnostic information

output unit for storing the determination information of the abnormal current and

outputting the same to an external vehicle controller.

8. (original) The electric power controller as set forth in claim 6, wherein the

controller controls the switching unit to switch its OFF state to its ON state when

receiving a reset signal from an external vehicle controller.

9. (original) The electric power controller as set forth in claim 6, wherein the

voltage detector outputs the voltage to an external vehicle controller.

10. (original) The electric power controller as set forth in claim 6, wherein the

voltage detector comprises:

an element for measuring a voltage of the vehicle battery; and

an amplifier for amplifying a voltage difference between terminals of the

element.

11. (original) The electric power controller as set forth in claim 6, wherein the

controller adjusts occurrence intervals of switching control signals corresponding to

respective ON and OFF states if the vehicle battery outputs a transient current, so as to

reduce a magnitude of power supplied to the vehicle load.

12. (currently amended) An electric power controller for a vehicle,

comprising:

an overheat detector for detecting whether a power line supplying power

from a vehicle battery to the a vehicle load is overheated:

12

International Filing Date: 16 July 2004 Attorney Docket No.: 21334-1565

a voltage detector for detecting a voltage of the vehicle battery;

a voltage converter for converting power from the vehicle battery into a

proper voltage and outputting a switching control signal reflecting the proper voltage;

a switching unit for performing ON/OFF switching operations based on

the switching control signal to control power from the vehicle battery to the vehicle load;

and

a controller for inputting an overheat signal from the overheat detector and

the voltage from the voltage detector, determining whether there is an abnormal current,

and outputting a switching control signal, corresponding to a result to analyze change of

the voltage, to the switching unit,

wherein the electric power controller is installed in a printed circuit board

of a junction box and electrically connected thereto.

13. (original) The electric power controller as set forth in claim 12, wherein

the electric power controller is integrated with the junction box as compliant pins of the

electric power controller are inserted into throughholes in the printed circuit board of the

junction box.

14. (original) The electric power controller as set forth in claim 12, wherein:

the controller outputs determination information of the abnormal current

according to the change of the voltage; and

the electric power controller further comprises a diagnostic information

output unit for storing the determination information of the abnormal current and

outputting the same to the outside.

13

International Filing Date: 16 July 2004 Attorney Docket No.: 21334-1565

15. (original) The electric power controller as set forth in claim 14, wherein

the diagnostic information output unit notifies an external vehicle controller of the

determination information of the abnormal current.

16. (original) The electric power controller as set forth in claim 12, wherein

the controller controls the switching unit to switch its OFF state to its ON state when

receiving a reset signal from an external vehicle controller.

17. (original) The electric power controller as set forth in claim 12, wherein

the voltage detector outputs the voltage to an external vehicle controller.

18. (original) The electric power controller as set forth in claim 12, wherein

the voltage detector comprises:

an element for measuring the voltage of the vehicle battery; and

an amplifier for amplifying a voltage difference between terminals of the

element.

19. (original) The electric power controller as set forth in claim 12, wherein

the controller adjusts occurrence intervals of switching control signals corresponding to

respective ON and OFF states to control the magnitude of effective value of the vehicle

power supplied to the vehicle load via the switching unit.

20. (original) The electric power controller as set forth in claim 19, wherein

the controller reduces a magnitude of power supplied to the vehicle load if the vehicle

battery outputs transient current.

21. (currently amended) An electric power controller for a vehicle,

comprising:

an overheat detector for detecting whether a power line supplying power

from a vehicle battery to loads is overheated;

1541248\_1.DOC (21334-1565)

14

International Filing Date: 16 July 2004 Attorney Docket No.: 21334-1565

a voltage detector for detecting a voltage of the vehicle battery;

a voltage converter for converting power from the vehicle battery into a proper voltage and outputting a switching control signal reflecting the proper voltage;

a switching unit for performing ON/OFF switching operations based on the switching control signal to control power from the vehicle battery to the vehicle load loads; and

a controller for inputting an overheat signal from the overheat detector and the voltage from the voltage detector, determining whether there is an abnormal current, and outputting a switching control signal, corresponding to a result to analyze a change of the voltage, to the switching unit,

wherein the electric power controller is installed in a printed circuit board of a junction box, and electrically connected thereto by a line connector such that one end of the line connector is connected to an input/output interface terminal of the printed circuit board and the other end thereof.

22. (original) The electric power controller as set forth in claim 21, wherein:

the controller outputs determination information of the abnormal current according to the change of the voltage; and

the electric power controller further comprises a diagnostic information output unit for storing the determination information of the abnormal current and outputting the same to the outside.

23. (original) The electric power controller as set forth in claim 22, wherein the diagnostic information output unit notifies an external vehicle controller of the determination information of the abnormal current.

International Filing Date: 16 July 2004 Attorney Docket No.: 21334-1565

24. (original) The electric power controller as set forth in claim 21, wherein the controller controls the switching unit to switch its OFF state to its ON state when receiving a reset signal from an external vehicle controller.

- 25. (original) The electric power controller as set forth in claim 21, wherein the voltage detector outputs the voltage to an external vehicle controller.
- 26. (original) The electric power controller as set forth in claim 21, wherein the voltage detector comprises:

an element for measuring a voltage of the vehicle battery; and
an amplifier for amplifying a voltage difference between terminals of the element.

- 27. (original) The electric power controller as set forth in claim 21, wherein the controller adjusts occurrence intervals of switching control signals corresponding to respective ON and OFF states to control the magnitude of effective value of the vehicle power supplied to vehicle load via the switching unit.
- 28. (original) The electric power controller as set forth in claim 27, wherein the controller reduces the magnitude of power supplied to the vehicle loads if the vehicle battery outputs a transient current.
